

10 Scenario-Based Problems on Input and Output in C Programming

Questions Only – No Solutions or Answers

1. Student Marks Calculator

A teacher wants to enter the marks of three subjects and display the total and average marks. Write a C program that accepts marks for English, Mathematics, and Computer Science and displays the total and average.

2. Student Information

A college wants to collect basic information about a student. Accept the student's name, age, and percentage and display the information in a formatted manner.

3. Simple Bill Generation

A shopkeeper wants to calculate the bill for a product. Input the product name, quantity, and price per item. Display the total bill amount.

4. Temperature Conversion

A weather application receives temperature in Celsius but needs to display it in Fahrenheit. Input the temperature in Celsius and display the equivalent Fahrenheit temperature. Use the formula: $F = (C \times 9 / 5) + 32$.

5. Employee Salary Details

A company wants to calculate an employee's gross salary. Input employee name, basic salary, HRA, and DA. Display the gross salary. Use the formula: $\text{Gross Salary} = \text{Basic Salary} + \text{HRA} + \text{DA}$.

6. Reading a Single Character

A computer application asks the user to enter their gender as a single character. Use `getchar()` to accept one character and `putchar()` to display it.

7. Reading a Complete Sentence

A feedback system allows a student to enter a complete sentence containing spaces. Use `fgets()` to read the student's feedback and display it using `printf()`.

8. ATM Withdrawal Information

An ATM asks the customer for their account number and withdrawal amount. Accept the account number and withdrawal amount and display the transaction details.

9. Product Price with Discount

An online shopping website wants to calculate the final price after applying a discount. Input product name, original price, and discount percentage. Display the discount amount and final price.

10. Student Registration Form

A college registration system asks a student to enter their full name, roll number, age, and course. Write a C program that accepts the information and displays it as a registration summary.
